

# Oceanographic Data in the Greenland Sea and Around Svalbard in 1991-1993

Shuki USHIO, Hajime ITO and Nobuo ONO

*National Institute of Polar Research,  
9-10, Kaga 1-chome, Itabashi-ku, Tokyo 173-8515*

The Arctic Ocean is connected with the North Atlantic Ocean by the Fram Strait between Greenland and Svalbard. The strait is located in the northern part of the Greenland Sea (see Fig. 1). In the eastern part of the strait, warm saline water flows northward as the West Spitsbergen Current; while in the western part, cold less-saline water flows southward as the East Greenland Current. The northwestern part of the Greenland Sea is normally covered with sea ice even in summer. Furthermore, this region is regarded as a major area where the Arctic sea ice is discharged into mid latitude oceans. Thus, this area plays an important role in heat and salt exchange processes in the Arctic marine system.

To reveal exchange processes of water masses and ocean-atmosphere interaction in high-latitude oceans, a number of international research programs have been focused on the Greenland Sea and its surrounding waters. As one of the international Arctic research programs, oceanographic studies have been executed in cooperation with the Norsk Polarinstitutt and other institutes under the leadership of the National Institute of Polar Research since 1991. Japanese scientists have been carrying out field observations in and around Svalbard. The observations include not only physical measurements but also biological surveys. This report presents physical oceanographic data obtained in the Greenland Sea in 1992 and 1993, and data around Svalbard from 1991 to 1993. Table 1 summarizes all the observations.

For research cruises in the Greenland Sea, the *R/V LANCE* has been chartered by the Norsk Polarinstitutt almost every year. In the cruises of August 1992 and 1993, water temperature profiles were taken with expendable bathythermographs (XBT). Figures 2 (a) and (b) show the ship's track and XBT stations. Temperature and depth accuracies of the XBT (model MK-30, made by the Tsurumi Seiki, Co., Japan) are  $\pm 0.1^\circ\text{C}$  and  $\pm 5\text{ m}$  or  $\pm 2\%$  of depth, respectively. The XBT temperature data were obtained at about 1-m intervals. XBT data at standard depths are shown in Table 2. In the 1992 cruise, the

Kongsfjorden, which is a fjord in the Svalbard area, was also studied.

Around Spitsbergen, one of the islands in the Svalbard archipelago, oceanographic observations were made on board two commercial boats, the *M/S ORIGO* and the *M/S POLARSTAR*, in July-August 1993. The measurements were obtained by conductivity-temperature-depth recorder (CTD), XBTs, and sampling of air which was in equilibrium with the surface water. The station locations are shown in Fig. 3. The CTD (model AST-1000M, made by ALEC Electronics Co., Japan) has temperature accuracy of  $\pm 0.05^{\circ}\text{C}$ , salinity accuracy  $\pm 0.05 \text{ psu}$  (practical salinity unit), and depth accuracy  $\pm 0.5 \text{ db}$  (decibar). These data were recorded at 0.5 db intervals. The CTD and XBT data at the standard depths are shown in Table 3 and Table 4, respectively. The air samples were analyzed to measure the partial pressure of carbon dioxide ( $p\text{CO}_2$ ) and that of methane ( $p\text{CH}_4$ ) in the surface water. The data are shown in Table 5.

Figure 4 shows the study area and observation stations in the Kongsfjorden. In this fjord, water temperature and salinity profiles were measured with CTD. These measurements were carried out in September 1991, in June 1992, and in May-June 1993. The CTD was cast from a winch on a small boat. Table 6 shows temperature and salinity data at standard depths and at the bottom of each station. Positions of CTD observations were measured with a GPS (Global Positioning System, model GP-70, made by FURUNO Electronics Co., Japan).

The authors would like to thank all the observers for their kind support in the field work and in data processing.

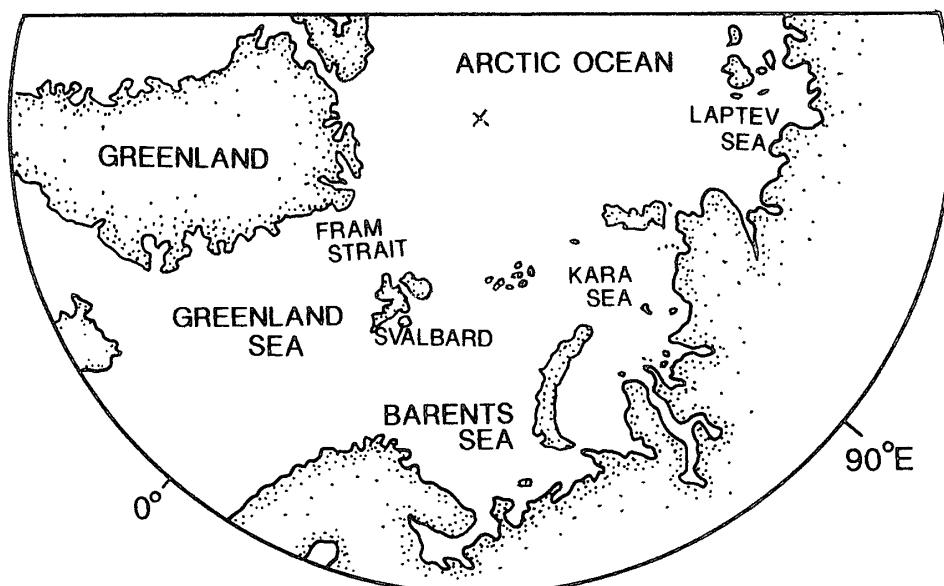

Fig. 1. Location map for the north polar oceans.

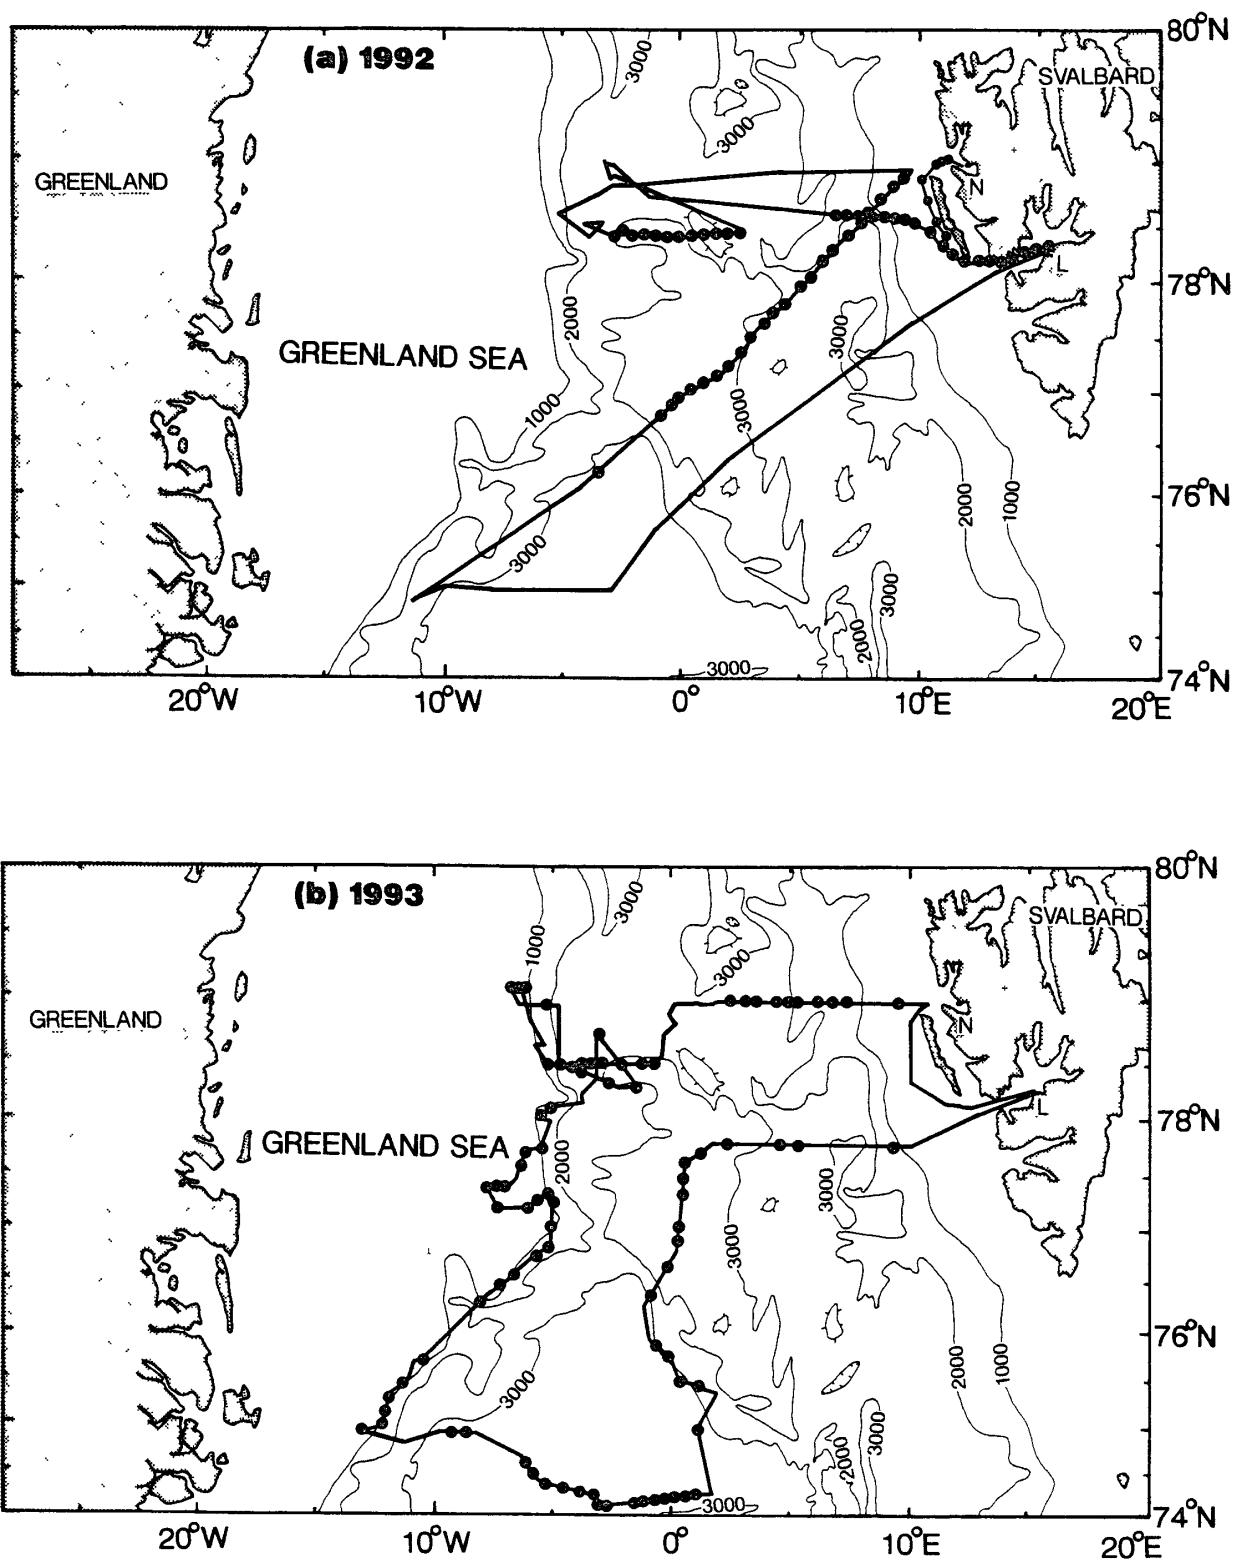

Fig. 2. Ship's track (thick line) and XBT observation stations (closed circles) of the *R/V LANCE* cruises in the Greenland Sea. Isobaths are in meters. The letter 'L' shows the port at Longyearbyen, 'N' the port at Ny-Ålesund. a) 1992 cruise, b) 1993 cruise.

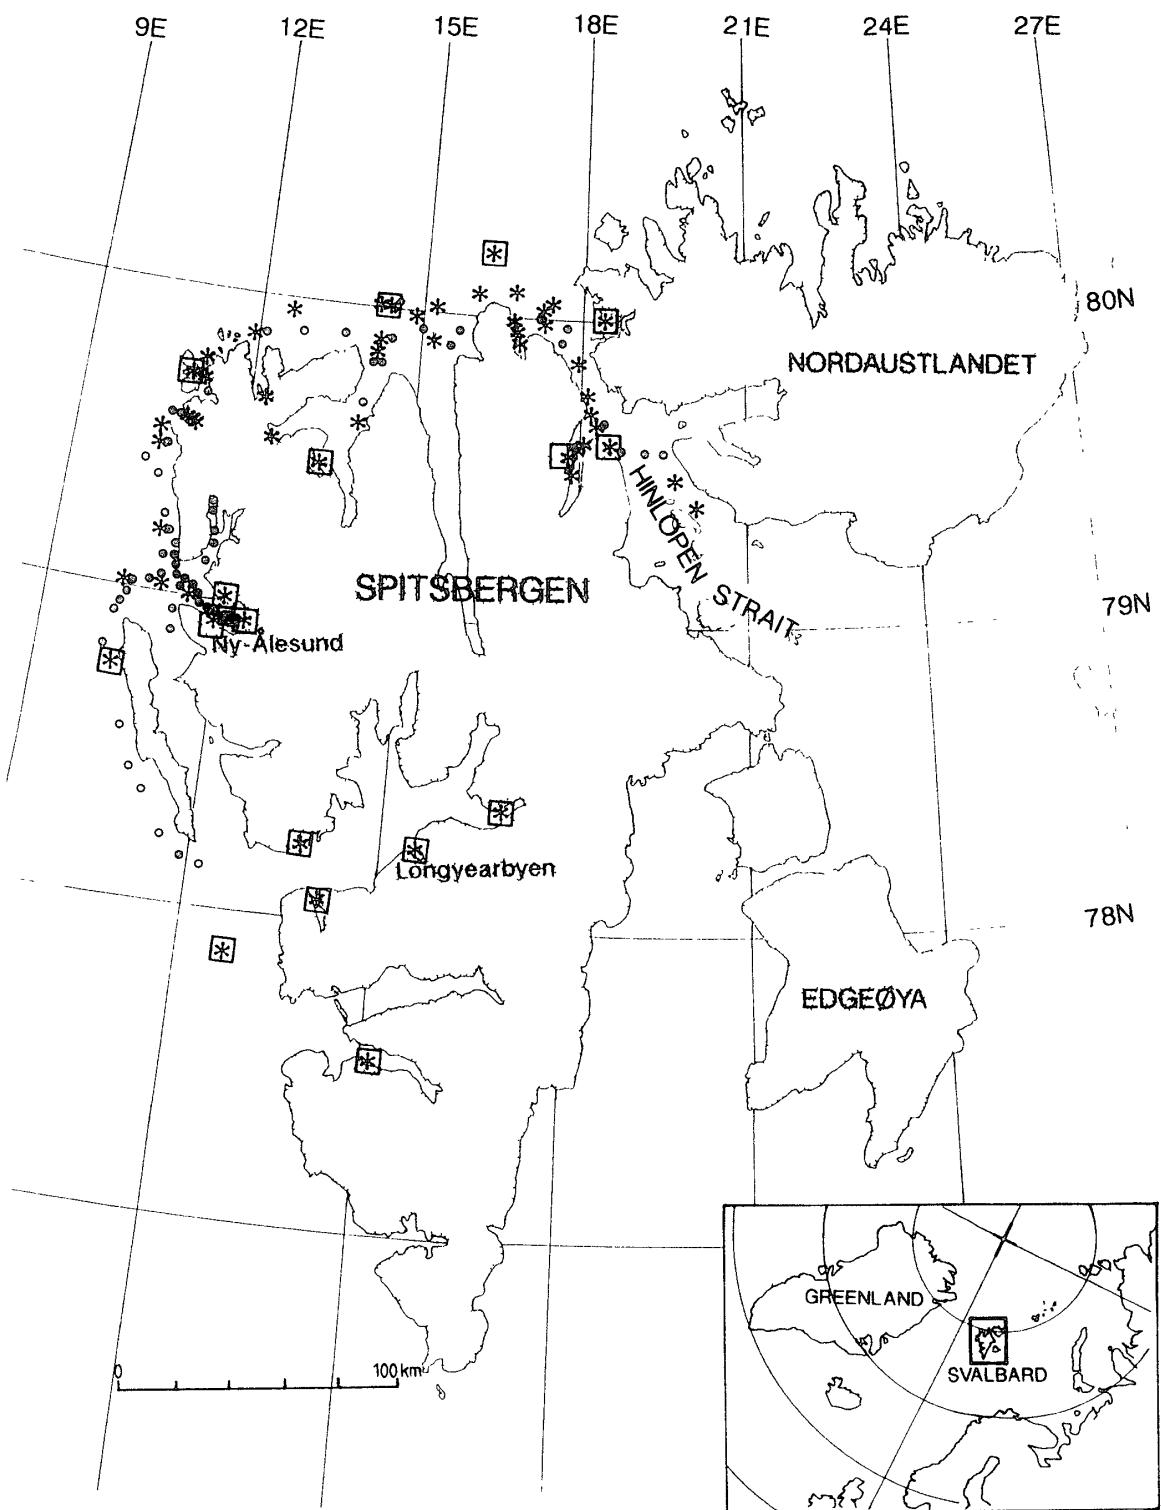

Fig. 3. Observation stations of the *M/S ORIGO* and *M/S POLARSTAR* around Spitsbergen, Svalbard, in 1993. Asterisks indicate the CTD station, closed circles the XBT stations, and open squares the sites of air sampling for measurement of  $p\text{CO}_2$  and  $p\text{CH}_4$ .

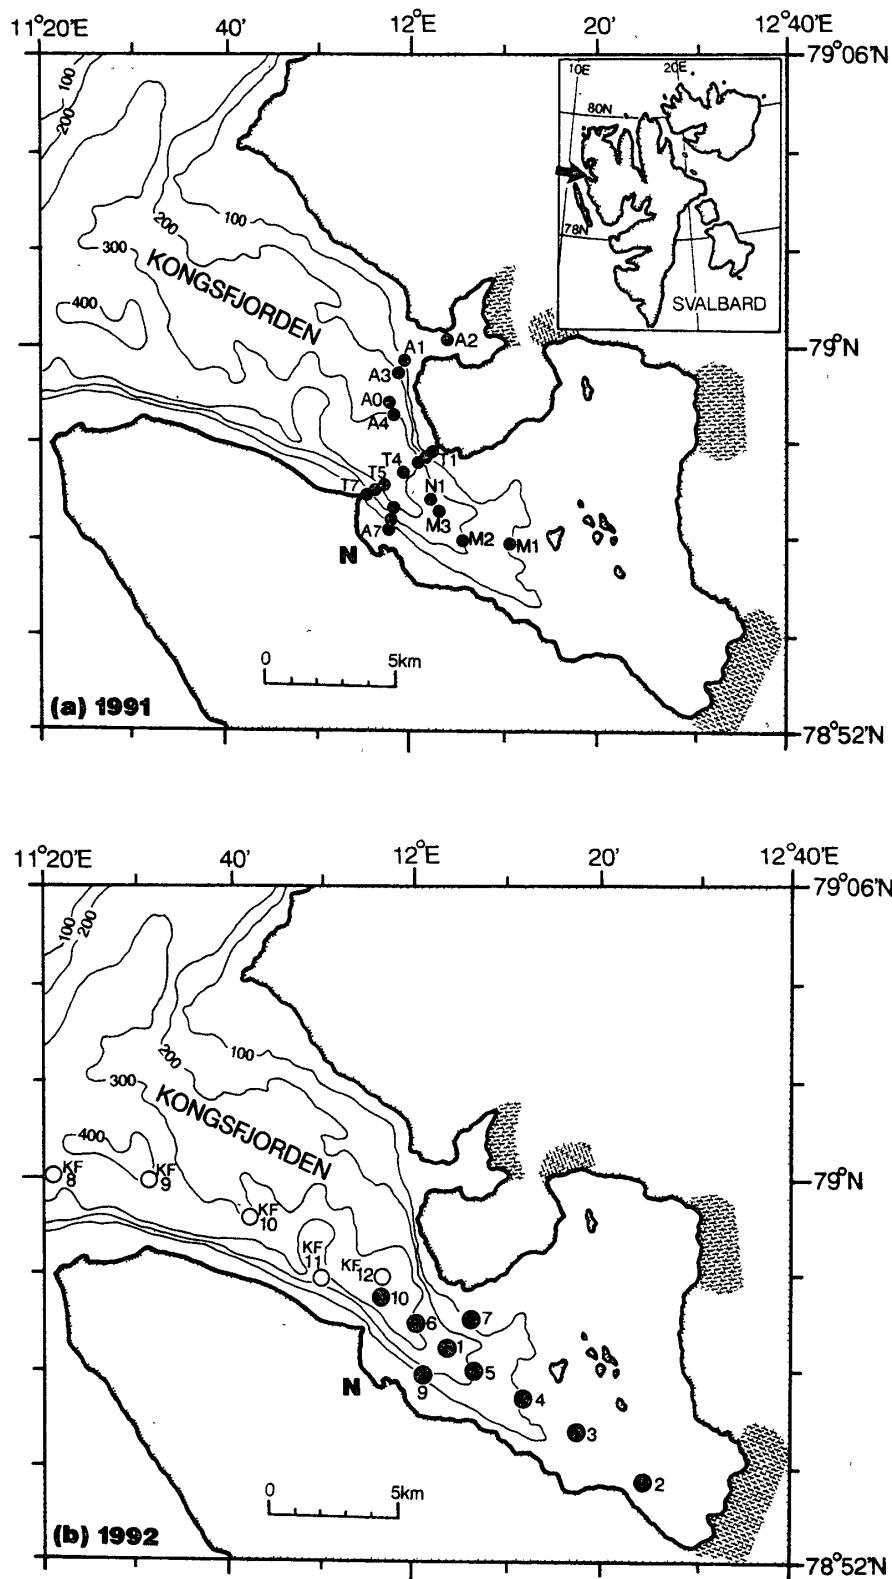

Fig. 4. Observation stations in the Kongsfjorden, Svalbard. Closed circles indicate the CTD stations, and open circles the XBT stations. The letter 'N' indicates the Japanese Ny-Ålesund observatory of the National Institute of Polar Research. The depth contours are in meters. Hatched areas along the shoreline show glacier terminals.  
 a) in 1991, b) in 1992, c) in 1993.

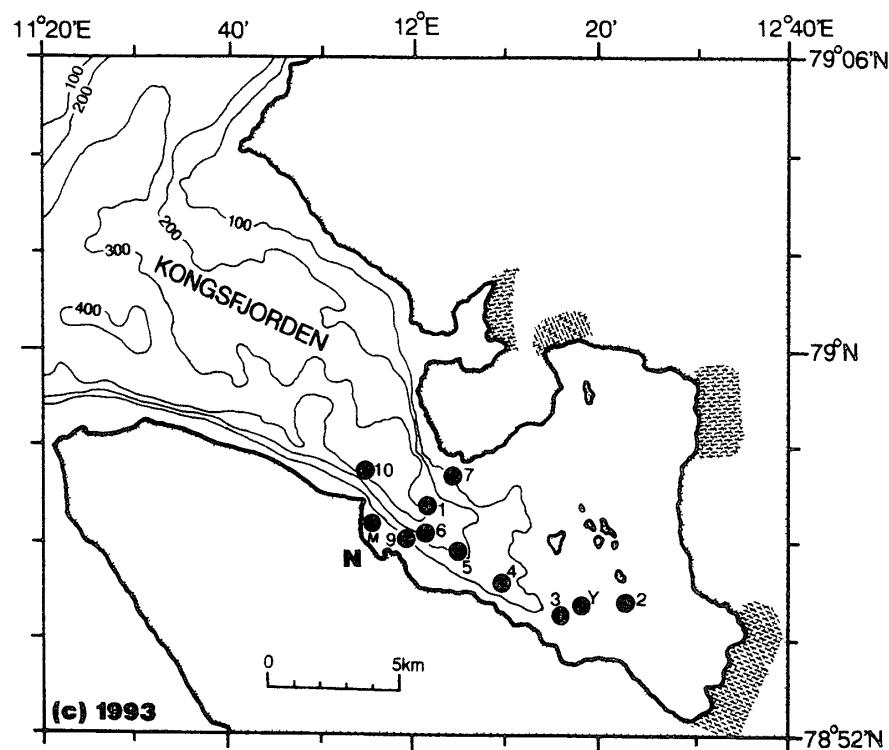

Table 1. Summary of observations.

Observation areas	Periods of observations	Observers	Items	Table No	page
Greenland Sea, Kongsfjorden	Aug 22-Sep. 1, 1992	Shuki Ushio, Meiji Honda	XBT	2-1	7
Greenland Sea	Aug. 17-29, 1993	Hajime Ito	XBT	2-2	12
